

Natal Image Factory

Design Overview — Prepared for Client Review · v1.0

What Is Natal Image Factory?

Natal Image Factory is a web application designed for writers and podcasters who want to turn their written articles and voiceover recordings into visually rich videos — without the tedious work of manually searching for images and aligning them to audio.

You upload your **article text** and your **voiceover audio**. The application does the rest: it breaks your narration into natural thematic segments, finds compelling public-domain images for each segment, and delivers a neatly packaged download ready for your video editor.

How It Works — At a Glance

Natal Image Factory — How It Works

Natal Image Factory · Design Overview · v1.0

The Four Steps

STEP 1A

Upload Your Article

Paste or upload the written text — plain text, Markdown, or Word documents are all accepted.

STEP 1B

Upload Your Voiceover

Upload the recorded narration in MP3, WAV, or any common audio format.

STEP 2 — AI ANALYSIS

Intelligent Segmentation

The application uses AI to read your article and analyze your voiceover. It divides the narration into **semantic segments** — natural topic boundaries where the subject shifts (e.g., from "the founding of Rome" to "military campaigns"). Each segment gets a precise **start and end timestamp**.

Think of it as the application creating an outline of your narration, with each bullet point getting its own illustration.

STEP 3 — IMAGE SEARCH

 Curated Public-Domain Image Matching

For each segment, the application searches trusted public-domain and open-license image collections for a single well-matched illustration:

Source	What You'll Find
Library of Congress	Historic photographs, maps, posters, prints
Wikimedia Commons	Paintings, diagrams, charts, lithographs
The Metropolitan Museum of Art	Classical and fine-art imagery
The Louvre (Collections)	European paintings and antiquities
Smithsonian Open Access	Science, history, and culture imagery
Unsplash	High-quality modern photography
Europeana	European cultural heritage
AI Generation (optional)	Custom illustrations when no suitable public-domain image exists

You can add or prioritize your own preferred sources in settings. The application also maintains its own curated default list that evolves over time.

STEP 4 — OUTPUT PACKAGE

 Download Your .ZIP

The application delivers a single **.zip file** containing numbered images and a timestamps reference file.

Image Files

```
Img_01_roman_map.jpg
Img_02_legion_formation.jpg
Img_03_colosseum_lithograph.jpg
Img_04_fall_of_rome.jpg
```

Timestamps File (timestamps.txt)

```
Img_01 | 0:00 - 1:42 | Origins of the Roman Empire
Img_02 | 1:42 - 3:55 | Military expansion across Europe
Img_03 | 3:55 - 5:10 | Art and architecture of imperial Rome
Img_04 | 5:10 - 7:38 | The decline and fall
```

You simply drag the images into your video timeline at the indicated timestamps. Done.

Your Settings — Your Creative Control

Visual Style

Choose a visual tone that matches your content:

Style	Description
Classical Antiquity	Greco-Roman art, marble sculptures, ancient maps
Medieval	Illuminated manuscripts, tapestries, woodcuts
Renaissance	Oil paintings, anatomical sketches, cartography
Modern / Contemporary	Photography, clean diagrams, infographics
AI Judgement	Let the application choose the best fit per segment automatically

Preferred Image Sources

Add your favorite museums, archives, or libraries. The application will prioritize these when searching, while still falling back on its full curated list if needed.

AI-Generated Images

Toggle this on or off. When enabled, if the application cannot find a strong public-domain match for a particular segment, it will generate a custom illustration using AI image generation, styled to match your chosen visual tone.

What Makes This Different?

Saves Hours of Work

No more manually Googling images, checking licenses, and renaming files.

Legally Safe

All images are public-domain or open-license. AI images are original works.

Intelligent, Not Random

AI reads your content and understands themes — not just keyword matching.

Works With Any Editor

Simple image files + text file. Premiere, Final Cut, DaVinci, CapCut — anything.

Your Preferences Matter

Choose the visual era, the sources, and whether to use AI art.

Access From Anywhere

Cloud-hosted, browser-based. No software to install.

The Experience — What You'll See

- 1 **Log in** to the web application from any browser.
- 2 **Create a new project** — give it a name (e.g., "Episode 47 — The Fall of Rome").
- 3 **Upload** your article text and voiceover audio.
- 4 **Choose your settings** — visual style, preferred sources, AI generation toggle.

- 5 **Click "Generate"** — the application processes your content (typically a few minutes).
- 6 **Review** the proposed segments and images on screen. Swap any image you don't like.
- 7 **Download** the .zip package.
- 8 **Import into your video editor** and drop the images at the indicated timestamps.

Where It Runs

The application is designed to run in the cloud (initially on DigitalOcean), so you access it through your web browser — no software to install. It is built to be portable, meaning it can be moved to any hosting provider in the future without rework.

What Happens Next?

This document is for your review and approval. Once you're happy with the concept and workflow, we will:

1. **Produce a detailed technical design** — specifying exact technologies, architecture, and integrations.
2. **Create an implementation plan** — with phases, milestones, and timelines.
3. **Begin development** — starting with the core upload-and-segmentation pipeline, then adding image search and packaging.

Questions?

If anything in this document is unclear, or if you'd like to add, remove, or change any feature, now is the perfect time. This design is shaped around your workflow — your feedback makes it better.
